SUMMARY

Backend engineer with 4+ years building production banking systems in Java, Spring Boot and Spring WebFlux. I lead backend development for City Union Bank, where I cut login-flow API time by 60%, built a standalone payment gateway and took a 15-minute batch job to seconds; earlier I built core-banking and fund-transfer APIs for Indian Bank and owned go-live modules for a second bank rollout.

SKILLS

Languages: Java, SQL
Backend: Spring Boot, Spring WebFlux (Reactor), Spring Security, Spring AOP, Hibernate, REST APIs, Microservices
Reliability: Resilience4j, ShedLock, idempotent batch processing, transaction management, query optimization
Data & tools: Oracle, MySQL, Git, Maven, Postman, Apache Tomcat, Firebase, Linux

EXPERIENCE

Senior Software Engineer · *i-exceed Technology Solutions Private Limited* **Aug 2022 – Present**

City Union Bank — Retail Banking Apr 2025 – Present
Lead Backend Developer · Chennai (onsite)

- Cut **login-flow API time from 17.4 s to 7.0 s** and **dashboard load from 10.2 s to 4.2 s** with Mono.zip parallel calls, N+1 query removal, async fraud scoring and non-blocking Netty event loops.
- Built the **payment gateway as a standalone application** (server, web front end and microservice), with pre-debit validation so a customer is not charged while the merchant is left uninformed.
- Designed an **idempotent standing-instruction migration** from legacy netbanking that runs alongside live payments: ShedLock across pods, per-record failure isolation, and staging until reconciliation.
- Took the **BBPS biller master-data job from 10–15 minutes to seconds** with parallel processing and transaction management, fixing the half-written loads and out-of-memory pod crashes it caused.
- Added **backend-driven customer-segment access control** to a tightly coupled app, enforced on client and server.
- Own **BBPS bill payments, transfers, RSA, FRM and notifications**; lead solution design with the bank.

Indian Bank — Ind Smart Mobile Banking Dec 2022 – Mar 2025
Backend Developer, Onsite L3 Engineer · Chennai and Bengaluru

- One of **two backend engineers** on a mobile banking app handling 200K+ daily transactions; with my lead, built its first CBS integrations: Customer Details and **NEFT, RTGS and IMPS fund transfers**.
- Built APIs for beneficiaries, accounts, limits, cards, deposits, service requests and bill payments over CBS, NPCI and third-party services; added **Resilience4j circuit breakers** on CBS and middleware calls.
- Also **owned Bill Payments, RSA and SIM Binding end to end** for a parallel bank rollout on the same platform, plus its admin, reporting and CBS integrations, to bring its go-live forward.
- Fixed **security (VAPT) findings under deadline**: payload encryption, session and token hardening, request-ownership and transaction-limit checks, input validation and log masking.
- **Onsite L3 engineer in Chennai for 19 months**, resolving 100+ production issues.

Omni Channel Banking Platform — i-exceed product Aug 2022 – Present
Product Contributor

- Built and extended **configuration-driven API integration**: JSON definitions of endpoint, headers, request/response mapping and placeholders, so each bank's APIs are wired through configuration.
- Turned project work into **reusable product features**: RSA, limit enhancement, account-product mapping.

ACHIEVEMENTS

- **Winner, i-exceed hackathon (Feb 2024)**, written CEO appreciation; built the backend of a microservice uptime dashboard.

EDUCATION

B.Tech, Computer Science and Engineering, *Assam Don Bosco University* Aug 2018 – May 2022
